FAQs

Help Build Global ETD Search

[Home](#) » [Thesis Resources](#) » Help Build Global ETD Search

This page is for ETD repository managers or librarians who are setting up an ETD repository at their institution. Most students and researchers do not need to worry about this. For more information on adding their libraries and graduate schools into the global ETD search, please see the [FAQs](#).

NDLTD wants to build a comprehensive gateway to all doctoral and master-level theses and dissertations. This requires world-wide cooperation of all doctoral-degree granting institutions. As an organization dedicated to Open Access, NDLTD will harvest metadata from thesis repositories regardless of the participating universities' NDLTD membership status. Yet, NDLTD relies on membership dues to support this work. [Please consider becoming an NDLTD member if access to thesis research is important to you.](#)

To contribute content to Global ETD Search, a university, a research institution, or a consortium of universities must build a repository of their Electronic Theses and Dissertations (ETDs). For help in setting up a local repository, please consult [Manage ETDs](#). It is the responsibility of local repository managers to develop acceptable open-access policies with their local communities. NDLTD encourages the maximum openness feasible: full text, all data, all metadata, and

The plant project : an urban agricultural intervention in Marabastad

Description

Dissertation (MArch(Prof))--University of Pretoria, 2015.

The dissertation investigates the notion of resilience in the urban environment. The potential for architecture to adapt to the changing contexts. The study focuses on regenerating decayed urban environments using a relationship between architecture and the landscape.

How to deal: Exploring the impact of coping, perceived control, and stress on immune function in patients with advanced cancer

Authors: [Ola, Olutoyin](#)

Year: 2019

Document Type: University of Pittsburgh ETD
PeerReviewed

Summary: Purpose: This study sought to uncover targets for psychosocial intervention with advanced **cancer patients** by elucidating the three-way interactions among coping, perceived control, and perceived **stress** and their impact on immune function. Background: In recent decades, **stress**-related immune dysfunction—namely, chronic inflammation—has been cited as the underlying mechanism through which a variety of chronic diseases of public health significance, including type II diabetes, cardiovascular disease, and dementias, develop. There is also evidence to suggest that **stress** only results in serious pathology when it is long-standing and unresolved. Thus, there is an opportunity to intervene such that **stress** does not result in chronic disease. Coping, according to Lazarus and Folkman, is the psychological construct encompassing the numerous ways with which one can deal with situations appraised as stressful. It is important to note that there are innumerable personal factors—such as one's perceived level of control—that can influence how one appraises a situation and copes when a situation is deemed stressful. Methods: The present study, a secondary analysis, explored which coping strategies advanced **cancer patients** use to handle their diagnoses and how those coping strategies impact immune function. Peripheral blood levels of the anti-inflammatory cytokine IL-10, the regulatory cytokine IL-2, and the pro-inflammatory cytokines IL-1alpha and beta were used to operationalize immune function as cytokines mediate the immune system's inflammatory response. **Patients'** self-reported coping strategies were grouped into coping profiles using PCA and cluster analysis, then linear regression models were constructed for each cytokine to assess for three-way interactions among coping, perceived control, and **stress**. Findings: Global F tests and likelihood ratio tests run on each regression model did not yield a significant p-value; however, there were several individual three-way interactions that were statistically significant. The results suggest that there is a need to investigate the person and environment variables that moderate the relationship between coping and **stress** and their impact on the immune system further.

Author Francis, Caroline M.

Title How Information Retrieval Systems Impact on Designers' Searching Strategies Within the Early Stages of the Design Process

URL <http://eprints.qut.edu.au/16280/>  

Publication Date 2006

University/Publisher Queensland University of Technology

Abstract The purpose of this research is to investigate the influences that Information Retrieval Systems such as online Search Engines and Databases have on designers' early searching strategies. The study involves the observation of designers transforming early design language into query 'keyword' language for the operation of Information Retrieval Systems and how this transition causes a shift in early design exploration. This transformation is referred to in this research as the CLASS activity; Converting Language from Abstract Searching to Specific. Findings show a common pattern across the activity of both professional and advanced student designers. Information Retrieval Systems are seen to drive the searching process into specific, explored domains rather than stimulate an 'abstract' broad investigation. The IR systems are built upon categories that are created to manage the information content. It is these categories that require a person to use defined keywords and query sentences to operate the Information Retrieval Systems. The findings suggest that using Information Retrieval Systems prior to defining the scope of a design problem causes designers to prematurely focus on specific searching.

Subjects/Keywords design activity; industrial design; searching strategies; searching practices; information retrieval systems; design language; classification; abstract searching; specific searching; online databases; design research

| Abstract: | <p>The Peneda Geres National Park situated in northern Portugal has many characteristics associated with remote locations: rural depopulation, low population density, homogeneous lifestyles, little economic diversity, high quality natural environment, and communities structured on a feudal or hierarchical set-up, with the church, traditionally, as the centre of influence. Traditionally, cooperation within and between communities revolved around agricultural activities that required a joint effort. Agricultural activities that required a high level of coordination resulted in the practically single form of association between residents. Residents still have strong cultural ties to nature, partially because of their reliance on sources of food and some income. There is evidence to suggest that community development with a significant emphasis on tourism may be an important element in the survival and revival of the economy of this region as traditional subsistence agriculture continues to decline. The promotion of small-scale tourism is intuitively perceived as a suitable form of economic development for rural areas. However, as communities turn to tourism as the means to raising income, employment and living standards the diverse impacts from tourism and its associated development affect the local population. A lack of community capacity and a lack of community understanding of tourism and its impacts have been identified as barriers to effective tourism development in this remote rural region. The overall purpose of this study is twofold. First, to critically examine and compare the attitudes to involvement, in and perceptions of, local associations of the residents of selected rural communities in the Peneda Geres National Park. Secondly, to determine resident perceptions of the contribution of local associations and the National Park Authority to the tourism development process. A survey in the form of a structured face-to-face interview was undertaken to analyse the perceptions of members of the communities toward tourism development by identifying the obstacles and impediments to community participation. A total of 346 usable questionnaires were collected using a randomly selected sample of residents in the parishes of Castro de Laboreiro, Entre-Ambosos- Rios and Vilar da Veiga. These three selected parishes illustrate the variety of experiences faced by communities involved with tourism. Findings from the interviews were identified which serve to illustrate participatory development as a complex and difficult though essential for community development in remote rural areas. Based on the findings, several recommendations on structural policies and advice on approach and issues in terms of research are made.</p> | | |

Abstract

Natural history museums are unique spaces for interdisciplinary research and educational innovation. Through extensive exhibits and public programming and by hosting rich communities of amateurs, students, and researchers at all stages of their careers, they can provide a place-based window to focus on integration of science and discovery, as well as a locus for community engagement. At the same time, like a synthesis radio telescope, when joined together through emerging digital resources, the global community of museums (the 'Global Museum') is more than the sum of its parts, allowing insights and answers to diverse biological, environmental, and societal questions at the global scale, across eons of time, and spanning vast diversity across the Tree of Life. We argue that, whereas natural history collections and museums began with a focus on describing the diversity and peculiarities of species on Earth, they are now increasingly leveraged in new ways that significantly expand their impact and relevance. These new directions include the possibility to ask new, often interdisciplinary questions in basic and applied science, such as in biomimetic design, and by contributing to solutions to climate change, global health and food security challenges. As institutions, they have long been incubators for cutting-edge research in biology while simultaneously providing core infrastructure for research on present and future societal needs. Here we explore how the intersection between pressing issues in environmental and human health and rapid technological innovation have reinforced the relevance of museum collections. We do this by providing examples as food for thought for both the broader academic community and museum scientists on the evolving role of museums. We also identify challenges to the realization of the full potential of natural history collections and the Global Museum to science and society and discuss the critical need to grow these collections. We then focus on mapping and modelling of museum data (including place-based approaches and discovery), and explore the main projects, platforms and databases enabling this growth. Finally, we aim to improve relevant protocols for the long-term storage of specimens and tissues, ensuring proper connection with tomorrow's technologies and hence further increasing the relevance of natural history museums.
